

B.S. in Forensic Psychology

Focused on applying psychological research and evidence-based practices to the legal field, the Forensic Psychology program brings together many of Embry-Riddle's strengths in areas such as applied psychology, social and behavioral research, and forensic sciences. Outside of the classroom, students have opportunities to mentor juvenile offenders, volunteer within local civil and criminal justice systems, conduct hands-on research, participate in professional networking, and present at scientific conferences.

At the **Prescott Campus**, the Bachelor of Science in Forensic Psychology provides students with a broad background in psychological and forensic sciences through lab experiences, coursework, and mentorship.

Students combine psychological training with a solid foundation in forensic science and the U.S. legal system. This training focuses on building knowledge of the behavioral and social sciences and the role they play in understanding and predicting human behavior.

Forensic Psychology students also have opportunities to work in the Forensic Science Laboratory, which offers space to learn forensic science techniques and carry out investigations related to criminal and civil cases. In addition, the campus is home to the Cold Case Task Force, where students can participate and partner with law enforcement and other agencies to investigate unresolved cases.

Outside of the classroom, students have opportunities to mentor juvenile offenders, volunteer within local civil and criminal justice systems, conduct hands-on research, participate in professional networking, and present at scientific conferences. Upon graduation, students are prepared to pursue careers in forensic psychology, clinical psychology, psychiatric counseling, and crime analysis, or to continue their education in a master's or doctoral program in psychology.
